Cover letter working draft — author approval required

Dear Editor,

We are preparing the manuscript "PW-pair-based two-stage MILP scheduling and structured solution methods for dual-source mixed-flow rotating-chamber cluster tools" for consideration by *Computers & Industrial Engineering*. The study develops a wafer-pair and batch-inventory representation of a full-occupancy scheduling problem with shared handling resources and reusable auxiliary wafers. It evaluates structured primal initialization and frozen learning-based cut-selection extensions using explicit model and comparison-budget boundaries. The current evidence shows conditional initialization benefits and verifiable execution schedules. It does not establish universal superiority of learned cuts. Historical models are reported separately from the current joint formulation. The work addresses computerized decision methods for industrial engineering. Before submission, the authors must complete the English manuscript, end-to-end and coupled-constraint validation, data-access arrangements, and author declarations. This draft does not certify originality, exclusive submission, or approval by all authors.

Corresponding author details are maintained on the separate title page.
